

## Features

- Full Power at Wide Output Current Range (Constant Power)
- Adjustable Output Current (AOC) with Programmability
- Isolated 1(0)-5V/1(0)-10V/10V PWM/3-Timer-Modes
- Adjustable Dimming Curve
- High Reliability & Long Lifetime: 119,000 hrs. at 70°C Case Temperature
- Dim-to-Low-Voltage with Standby Power  $\leq 0.5W$
- Output Lumen Compensation
- End-of-Life Indicator
- Input Surge Protection: DM 4kV, CM 6kV
- All-Around Protection: OVP, SCP, OTP
- IP66/IP67 (HV models)
- IP66 and UL Dry/Damp Location (HF models)
- SELV Output
- TYPE HL, for use in a Class I, Division 2 Hazardous (Classified) Location
- Suitable for Class I Luminaires
- 5 Years Warranty

## Description

The EUC-040SxxxHx series is a 40W, constant-current IP66/IP67 LED driver that operates from 90-305Vac input with excellent power factor. It is created for many lighting applications including tunnel and street, etc. The high efficiency of these drivers and compact metal case enable them to run cooler, significantly improving reliability and extending product life. To ensure trouble-free operation, protection is provided against input surge, output over voltage, short circuit, and over temperature.

## Protection Functions

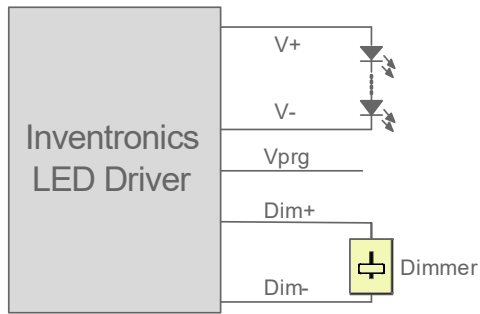

Parameter	Notes
Over Voltage Protection	Limits output voltage at no load and in case the normal voltage limit fails.
Short Circuit Protection	Auto Recovery. No damage shall occur when any output operating in a short circuit condition. The power supply shall be self-recovery when the fault condition is removed.
Over Temperature Protection	Decreases output current. Returning to normal after over temperature is removed.

## Dimming

### ● 1(0)-5V Dimming

The recommended implementation of the dimming control is provided below.

**Implementation 1: Positive logic**

**Implementation 2: Negative logic**

**Notes:**

1. Do NOT connect Dim- to the output V- or V+, otherwise the driver will not work properly.
2. The dimmer can also be replaced by an active 1(0)-5V voltage source signal or passive components like zener.
3. Dimming mode can be set as 0-5V or 1-5V by Inventronics Multi Programmer.

● **1(0)-10V Dimming**

The recommended implementation of the dimming control is provided below.

**Implementation 3: Positive logic (Default)**

**Notes:**

1. Do NOT connect Dim- to the output V- or V+, otherwise the driver will not work properly.
2. The dimmer can also be replaced by an active 1(0)-10V voltage source signal or passive components like zener.
3. Dimming mode can be set as 0-10V or 1-10V by Inventronics Multi Programmer, 1-10V is default.

● **10V PWM Dimming**

The recommended implementation of the dimming control is provided below.

**Implementation 4: Positive logic**

**Notes:**

1. Do NOT connect Dim- to the output V- or V+, otherwise the driver will not work properly.

● **Adjustable Dimming Curve**

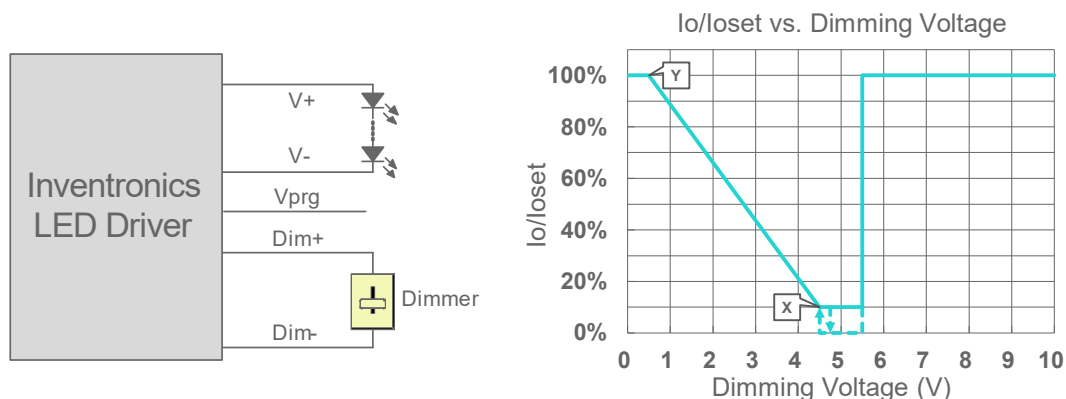

0-10V curve can be set as corresponding dimming voltage by Inventronics Multi Programmer. The recommended implementation of the dimming control is provided below.

When dimming voltage X point is set to be smaller than Y point, the dimming curve is positive logic.

**Implementation 5: Positive logic**

When X point is set to be bigger than Y point, the dimming curve is negative logic, and dimming voltage > 5.5V, the driver will output maximum current. If Dim+ is open, the driver will output maximum current.

**Implementation 6: Negative logic**

**Notes:**

1. Do NOT connect Dim- to the output V- or V+, otherwise the driver will not work properly.
2. The dimmer can also be replaced by an active 0-10V voltage source signal or passive components like zener.
3. For best dimming accuracy, the difference between X point and Y point is advised not less than 4V.

● **Time Dimming**

Time dimming control includes 3 kinds of modes, they are Self Adapting-Midnight, Self Adapting-Percentage and Traditional Timer.

- **Self Adapting-Midnight:** Automatically adjusts the dimming curve based on the on-time of past two days (if difference <15 minutes), assuming that the center point of the dimming curve is midnight local time.
- **Self Adapting-Percentage:** Automatically adjusts the on-time of each step by a constant percentage = (actual on-time for the past 2 days if difference <15 min) / (programmed on-time from the dimming curve).
- **Traditional Timer:** Follows the programmed timing curve after power on with no changes.
- **Override Timer:** When the integrated timer is enabled, it is possible to override the dimming mode from 'Timer' into '1(0)-10V' by applying a voltage of 1(0)-10V between DIM+ and DIM-. Once a voltage  $\leq 10.5$  Vdc is detected the output current will coincide with the dimming voltage. By opening the DIM+ and DIM-circuitry, the LED driver will switch again to timer mode. During override, our product continues to count while the timer is being overridden. Once the override is removed, the output current returns to the same point in its timer cycle.

● **Output Lumen Compensation**

Output Lumen Compensation (OLC) may be used to maintain constant light output over the life of the LEDs by driving them at a reduced current when new, then gradually increasing the drive current over time to counteract LED lumen degradation.

● **End of Life**

End-of-Life (EOL) is providing a visual notification to a user that the LED module has reached the end of manufacturer-specified life and that the replacement is recommended. Once active, an indication is given at each power-up of the driver, which the driver indicates this through a lower light output during the first 1 minute before normal operation is continued.
