

# EFR32FG25 Gecko Wireless SoC Family

## Data Sheet

The EFR32FG25 Gecko SoC is an ideal solution for sub-GHz Wi-SUN applications for metering, lighting, and distribution automation.

The high-performance sub-GHz radio provides long range and is not susceptible to 2.4 GHz interference from technologies like Wi-Fi.

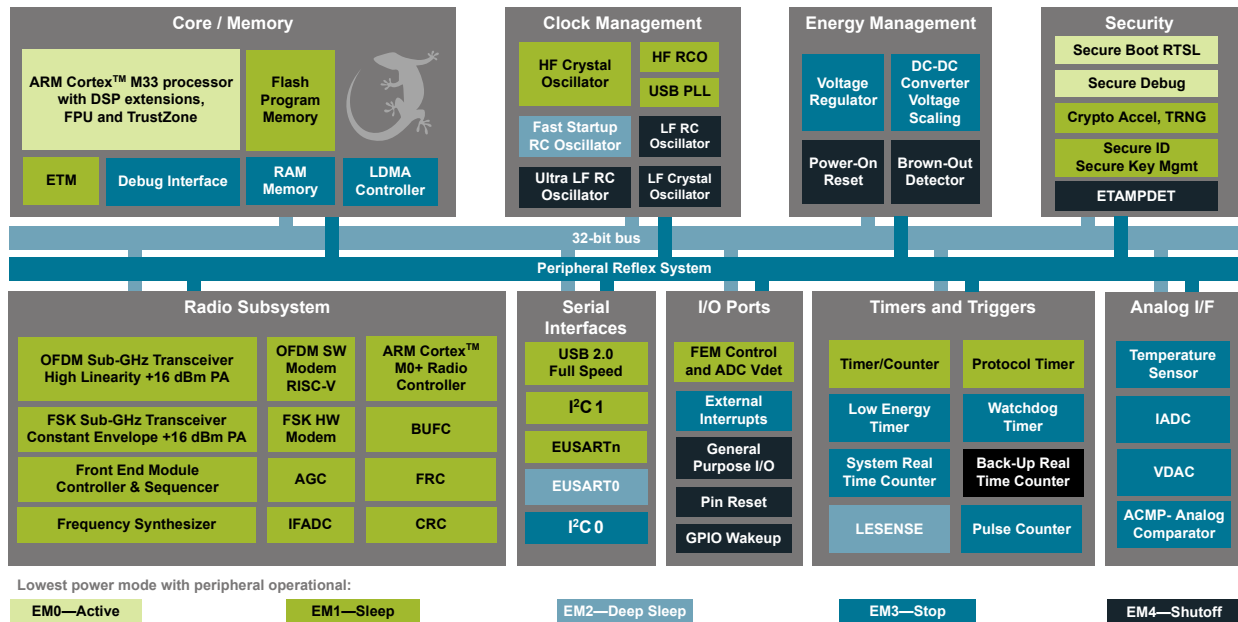

The single die, multi-core solution, provides industry leading security, high throughput, and an integrated power amplifier to enable the next level of secure connectivity for IoT devices.

EFR32FG25 applications include:

- Smart Electric Metering
- Street Lighting
- Distribution automation
- Industrial applications
- Municipal infrastructure

### KEY FEATURES

- 32-bit ARM® Cortex®-M33 core with 97.5 MHz maximum operating frequency
- Up to 1920 kB of flash and 512 kB of RAM
- Wi-SUN Multi-rate OFDM, FSK, and O-QPSK modulations
- Integrated PA with up to 16 dBm (Sub-GHz) TX power
- Robust peripheral set and up to 37 GPIO
- Operation up to 125 °C

## 1. Feature List

The EFR32FG25 highlighted features are listed below.

- **Low Power Wireless System-on-Chip**
  - High Performance 32-bit 97.5 MHz ARM Cortex<sup>®</sup>-M33 with DSP instruction and floating-point unit for efficient signal processing
  - Up to 1920 kB flash program memory
  - Up to 512 kB RAM data memory
  - Sub-GHz radio operation
  - TX power up to 16 dBm
- **Low Energy Consumption**
  - 6.3 mA RX current at 924 MHz (400 kbps 4-GFSK)
  - 58.6 mA TX current @ 13 dBm output power at 923.6 MHz with CW from FSK PA
  - 76.6 mA TX current @ 16 dBm output power at 915 MHz with CW from FSK PA
  - 186 mA TX current @ 16 dBm output power at 914 MHz (2.4 Mbps Wi-SUN OFDM Option 1, MCS6)
  - 30  $\mu$ A/MHz in Active Mode (EM0) at 97.5 MHz
  - 4.6  $\mu$ A EM2 DeepSleep current (512 kB RAM retention and RTC running from LFXO)
  - 2.6  $\mu$ A EM2 DeepSleep current (32 kB RAM retention and RTC running from LFRCO)
- **High Receiver Performance**
  - -107.5 dBm sensitivity @ 300 kbps 923.7 MHz Wi-SUN OFDM Option 3, MCS4
  - -114.5 dBm sensitivity @ 50 kbps 923.6 MHz Wi-SUN FSK #1b with FEC
  - -115.8 dBm sensitivity @ 12.5 kbps 923.6 MHz Wi-SUN OFDM Option 4, MCS0
  - -125.8 dBm sensitivity @ 4.8 kbps 915 MHz O-QPSK
  - -123.9 dBm sensitivity @ 6.25 kbps 914 MHz SUN O-QPSK
  - -114.6 dBm sensitivity @ 50 kbps 914 MHz Wi-SUN FSK #1b with FEC
  - -95.3 dBm sensitivity @ 2.4 Mbps 914 MHz Wi-SUN OFDM Option 1, MCS6
  - -116.0 dBm sensitivity @ 12.5 kbps 914 MHz Wi-SUN OFDM Option 4, MCS0
  - -114.1 dBm sensitivity @ 50 kbps 866.5 MHz Wi-SUN FSK #1a with FEC
  - -113.2 dBm sensitivity @ 50 kbps 866.5 MHz OFDM Option 4, MCS2
  - -114.5 dBm sensitivity @ 50 kbps 490 MHz OFDM Option 4, MCS2
- **Supported Modulation Format**
  - Wi-SUN MR OFDM MCS 0-6 (all 4 Options)
  - 802.15.4 SUN MR O-QPSK with DSSS
  - Wi-SUN FSK
  - 2 (G)FSK with fully configurable shaping
  - (G)MSK
- **Protocol Support**
  - Proprietary
  - Wi-SUN
- **Wide selection of MCU peripherals**
  - Analog to Digital Converter (ADC)
    - 12-bit @ 1 Msps
    - 16-bit @ 76.9 kbps
  - 2  $\times$  Analog Comparator (ACMP)
  - Digital to Analog Converter (VDAC) with two channels
  - Low-Energy Sensor Interface (LESENSE)
  - Up to 37 General Purpose I/O pins with output state retention and asynchronous interrupts
  - 16 Channel DMA Controller
  - 12 Channel Peripheral Reflex System (PRS)
  - 6  $\times$  16-bit Timer/Counter with 3 Compare/Capture/PWM channels
  - 2  $\times$  32-bit Timer/Counter with 3 Compare/Capture/PWM channels
  - 32-bit Real Time Counter
  - 24-bit Low Energy Timer for waveform generation
  - 2  $\times$  Watchdog Timer
  - 1  $\times$  USB2.0 Full Speed port, Device only
  - 5  $\times$  EUSART (Enhanced Universal Synchronous/Asynchronous Receiver/Transmitter)
    - EUSART0 operates in EM2
    - SPI and IrDA supported by EUSART
  - 2  $\times$  I<sup>2</sup>C interface with SMBus support
  - High Frequency Crystal Oscillator clock sharing using buffered sine wave clock output
  - Die temperature sensor with  $\pm 2$   $^{\circ}$ C typical accuracy across temperature range
- **Wide Operating Range**
  - 1.71 to 3.8 V VDD power supply
  - 3.45 to 3.8 V PAVDD power supply for OFDM
  - 3.0 to 3.8 V PAVDD power supply without OFDM
  - -40  $^{\circ}$ C to +125  $^{\circ}$ C
- **Secure Vault**
  - Hardware Cryptographic Acceleration for AES128/192/256, ChaCha20-Poly1305, SHA-1, SHA-2/256/384/512, ECDSA +ECDH(P-192, P-256, P-384, P-521), Ed25519 and Curve25519, J-PAKE, PBKDF2
  - True Random Number Generator (TRNG)
  - ARM<sup>®</sup> TrustZone<sup>®</sup>
  - Secure Boot (Root of Trust Secure Loader)
  - Secure Debug Unlock
  - DPA Countermeasures
  - Secure Key Management with PUF
  - Anti-Tamper
  - External Tamper Detection with dedicated external Active Tamper I/O pairs for use with tamper shields or protecting PCB traces
  - Secure Attestation
- **Packages**
  - **QFN56** 7 mm  $\times$  7 mm  $\times$  0.85 mm

### 3. System Overview

#### 3.1 Introduction

The EFR32 product family combines an energy-friendly MCU with a high performance radio transceiver. The devices are well suited for secure connected IoT multi-protocol devices requiring high performance and low energy consumption. This section gives a short introduction to the full radio and MCU system. The detailed functional description can be found in the EFR32xG25 Reference Manual.

A block diagram of the EFR32FG25 family is shown in [Figure 3.1 Detailed EFR32FG25 Block Diagram on page 8](#). The diagram shows a superset of features available on the family, which vary by part number. For more information about specific device features, consult [Ordering Information](#).

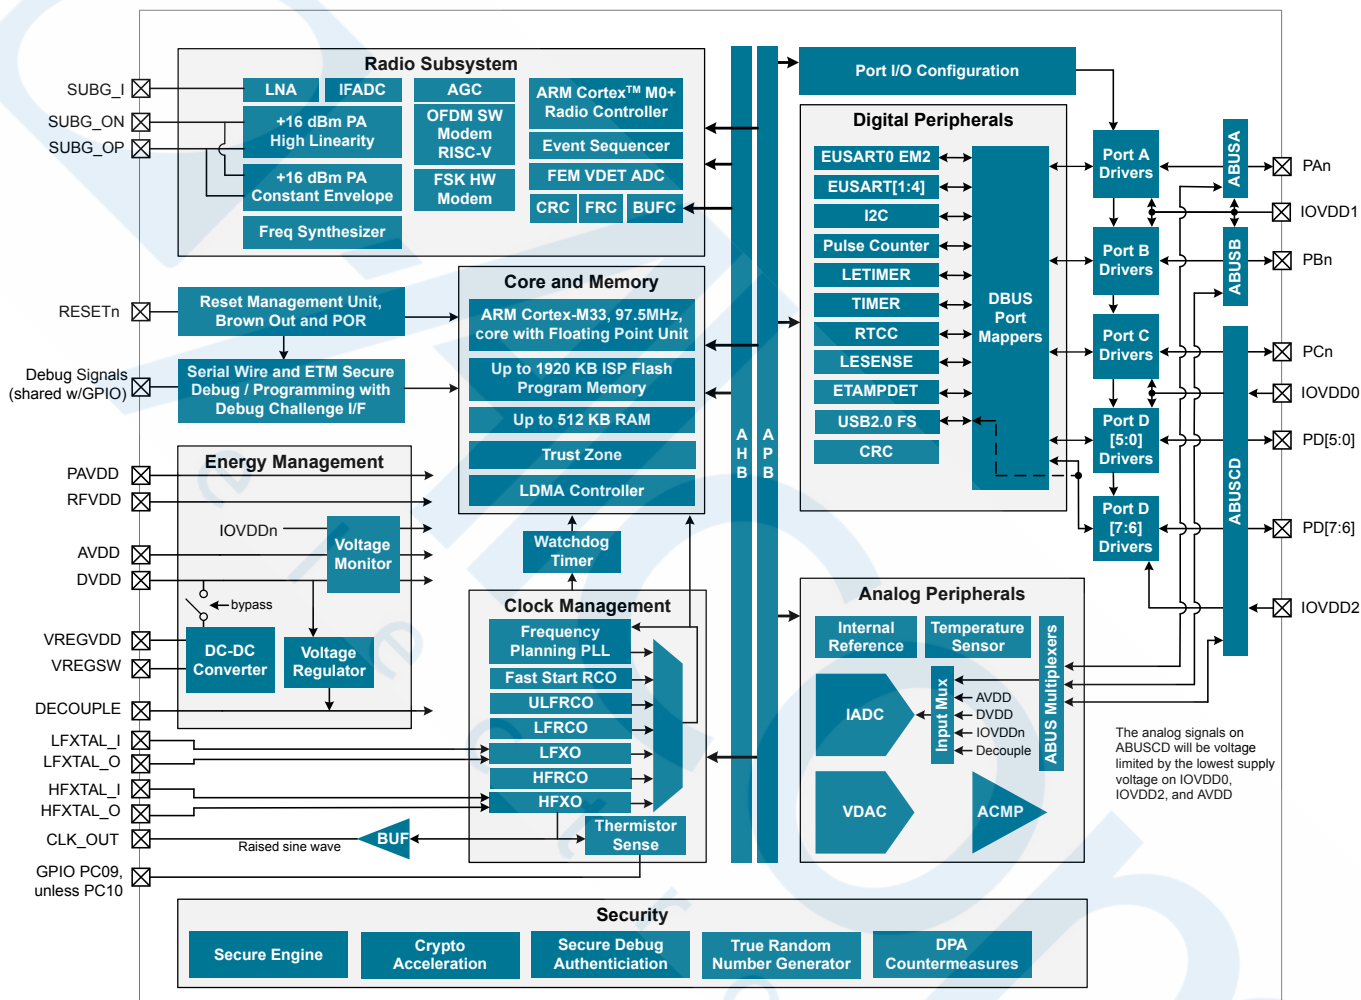

Figure 3.1. Detailed EFR32FG25 Block Diagram

#### 3.2 Radio

The Gecko family features two radio transceivers. A hardware modem and high efficiency PA supports proprietary wireless protocols, proprietary FSK, SUN FSK, and proprietary O-QPSK. A highly configurable software defined modem and high linearity PA supports SUN O-QPSK, and SUN OFDM.

### 3.2.1 Antenna Interface

The Sub-GHz antenna is attached to an RF matching network which interfaces to a single-ended input pin (SUBG\_I) that interface directly to the internal LNA input, and two differential output pins (SUBG\_ON and SUBG\_OP). The SUBG\_ON and SUBG\_OP pins interface internally to both +16 dBm differential PAs (the constant envelope high efficiency PA, and the high linearity OFDM PA). The matching networks change based on the operating frequency band.

The external components, RF matching network, and power supply connections for the typical applications are shown in later sections.

### 3.2.2 Fractional-N Frequency Synthesizer

The EFR32FG25 contains a high performance, low phase noise, fully integrated fractional-N frequency synthesizer. The synthesizer is used in receive mode to generate the LO frequency for the down-conversion mixer. It is also used in transmit either as a direct modulation source for constant-envelope modulation or to provide an LO for up-conversion for other modulation schemes.

The fractional-N architecture provides excellent phase noise performance, frequency resolution better than 100 Hz, and low energy consumption. The synthesizer's fast frequency settling allows for very short receiver and transmitter wake up times to reduce system energy consumption.

### 3.2.3 Receiver Architecture

The EFR32FG25 uses a low-IF receiver architecture, consisting of a Low-Noise Amplifier (LNA) followed by an I/Q down-conversion mixer, employing a crystal reference. The I/Q signals are further filtered and amplified before being sampled by the IF analog-to-digital converter (IFADC).

The IF frequency is configurable from 150 kHz to 1371 kHz. The IF can further be configured for high-side or low-side injection, providing flexibility with respect to known interferers at the image frequency. In some circumstances the receiver will configure with a zero IF for OFDM.

The Automatic Gain Control (AGC) module adjusts the receiver gain to optimize performance and avoid saturation for excellent selectivity and blocking performance. The sub-GHz radio can be calibrated on-demand by the user for the desired frequency band.

Demodulation is performed in the digital domain. The demodulator performs configurable decimation and channel filtering to allow receive bandwidths ranging from 0.1 to 2530 kHz. High carrier frequency and baud rate offsets are tolerated by active estimation and compensation. Advanced features supporting high quality communication under adverse conditions include forward error correction by block and convolutional coding as well as Direct Sequence Spread Spectrum (DSSS).

A Received Signal Strength Indicator (RSSI) is available for signal quality metrics, for level-based proximity detection, and for RF channel access by Collision Avoidance (CA) or Listen Before Talk (LBT) algorithms. An RSSI capture value is associated with each received frame and the dynamic RSSI measurement can be monitored throughout reception.

The EFR32FG25 features two demodulators, one using integrated hardware for efficient FSK reception, and other using I and Q down-converter and firmware configurable demodulator for OFDM reception. Concurrent listening for FSK and OFDM signals is supported for selected PHYs. Once a signal is detected, only one can be demodulated.

### 3.2.4 Transmitter Architecture

The EFR32FG25 uses a direct-conversion transmitter architecture with two line ups. The first is for constant envelope modulation formats, the modulator controls phase and frequency modulation in the frequency synthesizer. Transmit symbols or chips are optionally shaped by a digital shaping filter. The shaping filter is fully configurable, including the BT product, and can be used to implement Gaussian or Raised Cosine shaping. The second is for complex modulations such as OFDM. This uses an I and Q up converter mixer, and a separate highly linear PA. The linear PA and the constant envelope PA are output on the same external pin, and can be used only one at a time.

Carrier Sense Multiple Access - Collision Avoidance (CSMA-CA) or Listen Before Talk (LBT) algorithms can be automatically timed by the EFR32FG25. These algorithms are typically defined by regulatory standards to improve inter-operability in a given bandwidth between devices that otherwise lack synchronized RF channel access.

### 3.2.5 Packet and State Trace

The EFR32FG25 Frame Controller has a packet and state trace unit that provides valuable information during the development phase. It features:

- Non-intrusive trace of transmit data, receive data and state information
- Data observability on a single-pin UART data output, or on a two-pin SPI data output
- Configurable data output bitrate / baudrate
- Multiplexed transmitted data, received data and state / meta information in a single serial data stream

### 3.2.6 Data Buffering

The EFR32FG25 features an advanced Radio Buffer Controller (BUFC) capable of handling up to 4 buffers of adjustable size from 64 bytes to 4096 bytes. Each buffer can be used for RX, TX or both. The buffer data is located in RAM, enabling zero-copy operations.

### 3.2.7 Radio Controller (RAC)

The Radio Controller controls the top level state of the radio subsystem in the EFR32FG25. It performs the following tasks:

- Precisely-timed control of enabling and disabling of the receiver and transmitter circuitry
- Run-time calibration of receiver, transmitter and frequency synthesizer
- Detailed frame transmission timing, including optional LBT or CSMA-CA

## 3.3 General Purpose Input/Output (GPIO)

EFR32FG25 has up to 37 General Purpose Input/Output pins. Each GPIO pin can be individually configured as either an output or input. More advanced configurations including open-drain, open-source, and glitch-filtering can be configured for each individual GPIO pin. The GPIO pins can be overridden by peripheral connections, like SPI communication. Each peripheral connection can be routed to several GPIO pins on the device. The input value of a GPIO pin can be routed through the Peripheral Reflex System to other peripherals. The GPIO subsystem supports asynchronous external pin interrupts.

All of the pins on ports A and port B are EM2 capable. These pins may be used by Low-Energy peripherals in EM2/3 and may also be used as EM2/3 pin wake-ups. Pins on ports C and D are latched/retained in their current state when entering EM2 until EM2 exit upon which internal peripherals could once again drive those pads.

A few GPIOs also have EM4 wake functionality. These pins are listed in the Alternate Function Table.

## 3.4 Clocking

### 3.4.1 Clock Management Unit (CMU)

The Clock Management Unit controls oscillators and clocks in the EFR32FG25. Individual enabling and disabling of clocks to all peripheral modules is performed by the CMU. The CMU also controls enabling and configuration of the oscillators. A high degree of flexibility allows software to optimize energy consumption in any specific application by minimizing power dissipation in unused peripherals and oscillators.

### 3.4.2 Internal and External Oscillators

The EFR32FG25 supports two crystal oscillators and fully integrates four RC oscillators, listed below.

- A high frequency crystal oscillator (HFXO) with integrated load capacitors, tunable in small steps, provides a precise timing reference for the MCU. The HFXO provides excellent RF clocking performance using a 39.0 MHz crystal. An integrated Thermistor Sense can accurately measure the temperature of this crystal. Internal adjustments to clock frequency can be implemented to compensate for crystal frequency shift over temperature. The HFXO can also support an external clock source such as a TCXO for applications that require an extremely accurate clock frequency over temperature. Typical TCXO current drain and start up time are higher than the temperature compensated crystal oscillator option.
- A 32.768 kHz crystal oscillator (LFXO) provides an accurate timing reference for low energy modes.
- An integrated high frequency RC oscillator (HFRCO) is available for the MCU system, when crystal accuracy is not required. The HFRCO employs fast start-up at minimal energy consumption combined with a wide frequency range, from 1 MHz to 80 MHz.
- An integrated fast start-up RC oscillator (FSRCO) that runs at a fixed 20 MHz
- An integrated low frequency 32.768 kHz RC oscillator (LFRCO) for low power operation where high accuracy is not required.
- An integrated ultra-low frequency 1 kHz RC oscillator (ULFRCO) is available to provide a timing reference at the lowest energy consumption in low energy modes.

## 3.5 Counters/Timers and PWM

### 3.5.1 Timer/Counter (TIMER)

TIMER peripherals keep track of timing, count events, generate PWM outputs and trigger timed actions in other peripherals through the Peripheral Reflex System (PRS). The core of each TIMER is a 16-bit or 32-bit counter with up to 3 compare/capture channels. Each channel is configurable in one of three modes. In capture mode, the counter state is stored in a buffer at a selected input event. In compare mode, the channel output reflects the comparison of the counter to a programmed threshold value. In PWM mode, the TIMER supports generation of pulse-width modulation (PWM) outputs of arbitrary waveforms defined by the sequence of values written to the compare registers. In addition some timers offer dead-time insertion.

See [3.13 Configuration Summary](#) for information on the feature set of each timer.

### 3.5.2 Low Energy Timer (LETIMER)

The unique LETIMER is a 24-bit timer that is available in energy mode EM0 Active, EM1 Sleep, EM2 Deep Sleep, and EM3 Stop. This allows it to be used for timing and output generation when most of the device is powered down, allowing simple tasks to be performed while the power consumption of the system is kept at an absolute minimum. The LETIMER can be used to output a variety of waveforms with minimal software intervention. The LETIMER is connected to the Peripheral Reflex System (PRS), and can be configured to start counting on compare matches from other peripherals such as the Real Time Clock.

### 3.5.3 System Real Time Clock with Capture (SYSRTC)

The System Real Time Clock (SYSRTC) is a 32-bit counter providing timekeeping down to EM3. The SYSRTC can be clocked by any of the on-board low-frequency oscillators, and it is capable of providing system wake-up at user defined intervals.

### 3.5.4 Back-Up Real Time Counter (BURTC)

The Back-Up Real Time Counter (BURTC) is a 32-bit counter providing timekeeping in all energy modes, including EM4. The BURTC can be clocked by any of the on-board low-frequency oscillators, and it is capable of providing system wake-up at user-defined intervals.

### 3.5.5 Watchdog Timer (WDOG)

The watchdog timer can act both as an independent watchdog or as a watchdog synchronous with the CPU clock. It has windowed monitoring capabilities, and can generate a reset or different interrupts depending on the failure mode of the system. The watchdog can also monitor autonomous systems driven by the Peripheral Reflex System (PRS).

## 3.6 Communications and Other Digital Peripherals

### 3.6.1 Universal Serial Bus (USB)

The optional USB on chip PHY is a full-speed/low-speed device mode USB 2.0 controller. The USB can be used in device only configurations, and uses PLL0 at 48 MHz based on the 39 MHz crystal oscillator used as reference clock for radio and MCU operation. The USB block supports both full speed (12 MBit/s) and low speed (1.5 MBit/s) operation. The USB device includes an internal dedicated Descriptor-Based Scatter/Gather DMA and supports up to 10 endpoints. Of these, 9 are Bulk endpoints which are configurable as IN or OUT or as interrupt IN endpoints, and endpoint 0 is pre-defined as CTRL IN. The on-chip PHY includes internal pull-up and pull-down resistors. Bus powered device is supported and requires external voltage regulator to supply 3.3 V to IOVDD2 whenever the system is powered. VBUS-sense requires external resistor voltage divider and uses a GPIO. USB Suspend mode, with less than 2.4 mA average current, is supported with radio receive mode at a low enough duty cycle. Radio TX is not supported in USB Suspend. Remote wakeup is supported and will use an EM2 timer.

### 3.6.2 Enhanced Universal Synchronous/Asynchronous Receiver/Transmitter (EUSART)

The Enhanced Universal Synchronous/Asynchronous Receiver/Transmitter supports full duplex asynchronous UART communication with hardware flow control, RS-485, and IrDA support. The EUSART also supports high-speed SPI. In EM0 and EM1 the EUSART provides a high-speed, buffered communication interface.

When routed to GPIO ports A or B, the EUSART0 may also be used in a low-energy mode and operate in EM2. A 32.768 kHz clock source allows full duplex UART communication up to 9600 baud. EUSART0 can also act as a SPI secondary device in EM2 and EM3, and wake the system when data is received from an external bus controller.

### 3.6.3 Inter-Integrated Circuit Interface (I<sup>2</sup>C)

The I<sup>2</sup>C module provides an interface between the MCU and a serial I<sup>2</sup>C bus. It is capable of acting as a main or secondary interface and supports multi-drop buses. Standard-mode, fast-mode and fast-mode plus speeds are supported, allowing transmission rates from 10 kbit/s up to 1 Mbit/s. Bus arbitration and timeouts are also available, allowing implementation of an SMBus-compliant system. The interface provided to software by the I<sup>2</sup>C module allows precise timing control of the transmission process and highly automated transfers. Automatic recognition of addresses is provided in active and low energy modes. Note that not all instances of I<sup>2</sup>C are available in all energy modes.

### 3.6.4 Peripheral Reflex System (PRS)

The Peripheral Reflex System provides a communication network between different peripheral modules without software involvement. Peripheral modules producing Reflex signals are called producers. The PRS routes Reflex signals from producers to consumer peripherals which in turn perform actions in response. Edge triggers and other functionality such as simple logic operations (AND, OR, NOT) can be applied by the PRS to the signals. The PRS allows peripherals to act autonomously without waking the MCU core, saving power.

### 3.6.5 Low Energy Sensor Interface (LESENSE)

The Low Energy Sensor Interface LESENSE™ is a highly configurable sensor interface with support for up to 16 individually configurable sensors. By controlling the analog comparators, ADC, and DAC, LESENSE is capable of supporting a wide range of sensors and measurement schemes, and can for instance measure LC sensors, resistive sensors and capacitive sensors. LESENSE also includes a programmable finite state machine which enables simple processing of measurement results without CPU intervention. LESENSE is available in energy mode EM2, in addition to EM0 and EM1, making it ideal for sensor monitoring in applications with a strict energy budget.

### 3.7 Secure Vault Features

A dedicated hardware secure engine containing its own CPU enables the Secure Vault functions. It isolates cryptographic functions and data from the host Cortex-M33 core, and provides several additional security features. The EFR32FG25 family includes devices with Secure Vault High and Secure Vault Mid capabilities, which are summarized in the table below.

**Table 3.1. Secure Vault Features**

Feature	Secure Vault Mid	Secure Vault High

#### 3.7.1 Secure Boot with Root of Trust and Secure Loader (RTSL)

The Secure Boot with RTSL authenticates a chain of trusted firmware that begins from an immutable memory (ROM).

It prevents malware injection, prevents rollback, ensures that only authentic firmware is executed, and protects Over The Air updates.

For more information about this feature, see [AN1218: Series 2 Secure Boot with RTSL](#).

### 3.7.2 Cryptographic Accelerator

The Cryptographic Accelerator is an autonomous hardware accelerator with Differential Power Analysis (DPA) countermeasures to protect keys.

It supports AES encryption and decryption with 128/192/256-bit keys, ChaCha20 encryption, and Elliptic Curve Cryptography (ECC) to support public key operations, and hashes.

Supported block cipher modes of operation for AES include:

- ECB (Electronic Code Book)
- CTR (Counter Mode)
- CBC (Cipher Block Chaining)
- CFB (Cipher Feedback)
- GCM (Galois Counter Mode)
- CCM (Counter with CBC-MAC)
- CBC-MAC (Cipher Block Chaining Message Authentication Code)
- GMAC (Galois Message Authentication Code)

The Cryptographic Accelerator accelerates Elliptical Curve Cryptography and supports the NIST (National Institute of Standards and Technology) recommended curves including P-192, P-256, P-384, and P-521 for ECDH (Elliptic Curve Diffie-Hellman) key derivation, and ECDSA (Elliptic Curve Digital Signature Algorithm) sign and verify operations. Also supported is the non-NIST Curve25519 for ECDH and Ed25519 for EdDSA (Edwards-curve Digital Signature Algorithm) sign and verify operations.

Secure Vault also supports ECJ-PAKE (Elliptic Curve variant of Password Authenticated Key Exchange by Juggling) and PBKDF2 (Password-Based Key Derivation Function 2).

Supported hashes include SHA-1, SHA-2/256/384/512 and Poly1305.

This implementation provides a fast and energy efficient solution to state of the art cryptographic needs.

### 3.7.3 True Random Number Generator

The True Random Number Generator module is a non-deterministic random number generator that harvests entropy from a thermal energy source. It includes start-up health tests for the entropy source as required by NIST SP800-90B and AIS-31 as well as online health tests required for NIST SP800-90C.

The TRNG is suitable for periodically generating entropy to seed an approved pseudo random number generator.

### 3.7.4 Secure Debug with Lock/Unlock

For obvious security reasons, it is critical for a product to have its debug interface locked before being released in the field.

In addition, Secure Vault High also provides a secure debug unlock function that allows authenticated access based on public key cryptography. This functionality is particularly useful for supporting failure analysis while maintaining confidentiality of IP and sensitive end-user data.

For more information about this feature, see [AN1190: Series 2 Secure Debug](#).

### 3.7.5 DPA Countermeasures

The AES and ECC accelerators have Differential Power Analysis (DPA) countermeasures support. This makes it very expensive from a time and effort standpoint to use DPA to recover secret keys.

### 3.7.6 Secure Key Management with PUF

Key material in Secure Vault High products is protected by "key wrapping" with a standardized symmetric encryption mechanism. This method has the advantage of protecting a virtually unlimited number of keys, limited only by the storage that is accessible by the Cortex-M33, which includes off-chip storage as well. The symmetric key used for this wrapping and unwrapping must be highly secure because it can expose all other key materials in the system. The Secure Vault Key Management system uses a Physically Unclonable Function (PUF) to generate a persistent device-unique seed key on power up to dynamically generate this critical wrapping/unwrapping key which is only visible to the AES encryption engine and is not retained when the device loses power.

### 3.7.7 Anti-Tamper

Secure Vault High devices provide internal tamper protection which monitors parameters such as voltage, temperature, and electromagnetic pulses as well as detecting tamper of the security sub-system itself. Additionally, 8 external configurable tamper pins support external tamper sources, such as enclosure tamper switches.

For each tamper event, the user is able to select the severity of the tamper response ranging from an interrupt, to a reset, to destroying the PUF reconstruction data which will make all protected key materials un-recoverable and effectively render the device inoperable. The tamper system also has an internal resettable event counter with programmable trigger threshold and refresh periods to mitigate false positive tamper events.

For more information about this feature, see [AN1247: Anti-Tamper Protection Configuration and Use](#).

### 3.7.8 External Tamper Detection

The External Tamper Detect (ETAMPDET) module enables detection of external tampering, such as unauthorized enclosure opening. ETAMPDET operates in all energy modes down to EM4. Up to two signals can be generated and monitored to identify external tamper events. When a tamper event occurs, an interrupt is generated to allow software to take system-appropriate actions.

ETAMPDET is available on OPNs with Security Vault level at both Mid and High. However, only Vault High OPNs can be configured such that the Tamper block within the SE will respond autonomously to an ETAMPDET event.

### 3.7.9 Secure Attestation

Secure Vault High products support Secure Attestation, which begins with a secure identity that is created during the Silicon Labs manufacturing process. During device production, each device generates its own public/private keypair and securely stores the wrapped private key into immutable OTP memory and this key never leaves the device. The corresponding public key is extracted from the device and inserted into a binary DER-encoded X.509 device certificate, which is signed into a Silicon Labs CA chain and then programmed back into the chip into an immutable OTP memory.

The secure identity can be used to authenticate the chip at any time in the life of the product. The production certification chain can be requested remotely from the product. This certification chain can be used to verify that the device was authentically produced by Silicon Labs. The device unique public key is also bound to the device certificate in the certification chain. A challenge can be sent to the chip at any point in time to be signed by the device private key. The public key in the device certificate can then be used to verify the challenge response, proving that the device has access to the securely-stored private key, which prevents counterfeit products or impersonation attacks.

For more information about this feature, see [AN1268: Authenticating Silicon Labs Devices Using Device Certificates](#).

## 3.8 Analog

Three analog buses route analog signals from the four GPIO ports to analog peripherals. These are ABUSA for GPIO Port A, ABUSB for GPIO Port B, and ABUSCD for GPIO Port C and Port D. The analog signals on ABUSA and ABUSB will be voltage limited by the lowest supply voltage on IOVDD1, and AVDD. The analog signals on ABUSCD will be voltage limited by the lowest supply voltage on IOVDD0, IOVDD2, and AVDD.

### 3.8.1 Analog to Digital Converter (IADC)

The IADC is a hybrid architecture combining techniques from both SAR and Delta-Sigma style converters. It has a resolution of 12 bits at 1 Msps and 16 bits at up to 76.9 ksp/s. Hardware oversampling reduces system-level noise over multiple front-end samples. The IADC includes integrated voltage reference options. Inputs are selectable from a wide range of sources, including pins configurable as either single-ended or differential.

### 3.8.2 Analog Comparator (ACMP)

The Analog Comparator is used to compare the voltage of two analog inputs, with a digital output indicating which input voltage is higher. Inputs are selected from among internal references and external pins. The tradeoff between response time and current consumption is configurable by software. Two 6-bit reference dividers allow for a wide range of internally-programmable reference sources. The ACMP can also be used to monitor the supply voltage. An interrupt can be generated when the supply falls below or rises above the programmable threshold.

### 3.8.3 Digital to Analog Converter (VDAC)

The Digital to Analog Converter (VDAC) can convert a digital value to an analog output voltage. The VDAC is a fully differential, 500 ksp/s, 12-bit converter. The VDAC may be used for a number of different applications such as sensor interfaces or sound output. The VDAC can generate high-resolution analog signals while the MCU is operating at low frequencies and with low total power consumption. Using DMA and a timer, the VDAC can be used to generate waveforms without any CPU intervention. The VDAC is available in all energy modes down to and including EM3.

## 3.9 Power

The EFR32FG25 has an Energy Management Unit (EMU) and efficient integrated regulators to generate internal supply voltages. Only a single external supply voltage is required, from which all internal voltages are created. An optional integrated DC-DC buck regulator can be utilized to further reduce the current consumption. The DC-DC regulator requires one external inductor and one external capacitor.

The EFR32FG25 device family includes support for internal supply voltage scaling, as well as two different power domains groups for peripherals. These enhancements allow for further supply current reductions and lower overall power consumption.

### 3.9.1 Energy Management Unit (EMU)

The Energy Management Unit manages transitions of energy modes in the device. Each energy mode defines which peripherals and features are available and the amount of current the device consumes. The EMU can also be used to implement system-wide voltage scaling and turn off the power to unused RAM blocks to optimize the energy consumption in the target application. The DC-DC regulator operation is tightly integrated with the EMU.

### 3.9.2 Voltage Scaling

The EFR32FG25 supports supply voltage scaling for the LDO powering DECOUPLE, with independent selections for EM2 and EM3. Voltage scaling helps to optimize the energy efficiency of the system by operating at lower voltages when possible. The EM0 / EM1 voltage scaling level is VSCALE2, which allows the core to operate in active mode at full speed. The intermediate level, VSCALE1, allows operation in EM2 and EM3. The lowest level, VSCALE0, can be used to conserve power further in EM2 and EM3. The EMU will automatically switch the target voltage scaling level when transitioning between energy modes.

### 3.9.3 DC-DC Converter

The DC-DC buck converter covers a wide range of load currents, providing high efficiency in energy modes EM0, EM1, EM2 and EM3. RF noise mitigation allows operation of the DC-DC converter without significantly degrading sensitivity of radio components. An on-chip supply-monitor signals when the supply voltage is low to allow bypass of the regulator via programmable software interrupt. It employs soft switching at boot and DCDC regulating-to-bypass transitions to limit the max supply slew-rate and mitigate inrush current.

### 3.9.4 Power Domains

Peripherals may exist on several independent power domains which are powered down to minimize supply current when not in use. Power domains are managed automatically by the EMU.

The lowest-energy power domain is the "high-voltage" power domain (PDHV), which supports extremely low-energy infrastructure and peripherals. Circuits powered from PDHV are always on and available in all energy modes down to EM4.

The next power domain is the low power domain (PD0), which is further divided to power subsets of peripherals. All PD0 power domains are shut down in EM4. Circuits powered from PD0 power domains may be available in EM0, EM1, EM2, and EM3.

Low power domain A (PD0A) is the base power domain for EM2 and EM3 and will always remain on in EM0-EM3. It powers the most commonly-used EM2 and EM3-capable peripherals and infrastructure required to operate in EM2 and EM3. Auxiliary PD0 power domains (PD0B, PD0C, PD0D, PD0E) power additional EM2 and EM3-capable peripherals on demand. If any peripherals on one of the auxiliary power domains is enabled, that power domain will be active in EM2 and EM3. Otherwise, the auxiliary PD0 power domains will be shut down to reduce current.

**Note:** Power domain PD0E is also turned on when peripherals on PD0B, PD0C, or PD0D are used.

The active power domain (PD1) powers the rest of the device circuitry, including the CPU core and EM0 / EM1 peripherals. PD1 is always powered on in EM0 and EM1. PD1 is always shut down in EM2, EM3, and EM4.

Table 3.2 Peripheral Power Subdomains on page 18 shows the peripherals on the PDHV and PD0x domains. Any peripheral not listed is on PD1.

**Table 3.2. Peripheral Power Subdomains**

Always On in EM2/EM3		Selectively On in EM2/3

**Note:**

1. Peripherals on PDHV are also available in EM4.
2. If any of PD0B, PD0C, or PD0D are enabled, PD0E will also be automatically enabled.

### 3.10 Reset Management Unit (RMU)

The RMU is responsible for handling reset of the EFR32FG25. A wide range of reset sources are available, including several power supply monitors, pin reset, software controlled reset, core lockup reset, and watchdog reset.

## 3.11 Core and Memory

### 3.11.1 Processor Core

The ARM Cortex-M processor includes a 32-bit RISC processor integrating the following features and tasks in the system:

- ARM Cortex-M33 RISC processor achieving 1.50 Dhrystone MIPS/MHz
- ARM TrustZone security technology
- Embedded Trace Macrocell (ETM) for real-time trace and debug
- Up to 1920 kB flash program memory
- Up to 512 kB RAM data memory
- Configuration and event handling of all modules
- 2-pin Serial-Wire debug interface

### 3.11.2 Memory System Controller (MSC)

The Memory System Controller (MSC) is the program memory unit of the microcontroller. The flash memory is readable and writable from both the Cortex-M33 and LDMA. In addition to the main flash array where Program code is normally written the MSC also provides an Information block where additional information such as special user information or flash-lock bits are stored. There is also a read-only page in the information block containing system and device calibration data. Read and write operations are supported in energy modes EM0 Active and EM1 Sleep.

### 3.11.3 Linked Direct Memory Access Controller (LDMA)

The Linked Direct Memory Access (LDMA) controller allows the system to perform memory operations independently of software. This reduces both energy consumption and software workload. The LDMA allows operations to be linked together and staged, enabling sophisticated operations to be implemented.

### 3.12 Memory Map

The EFR32FG25 memory map is shown in the figures below. RAM and flash sizes are for the largest memory configuration.

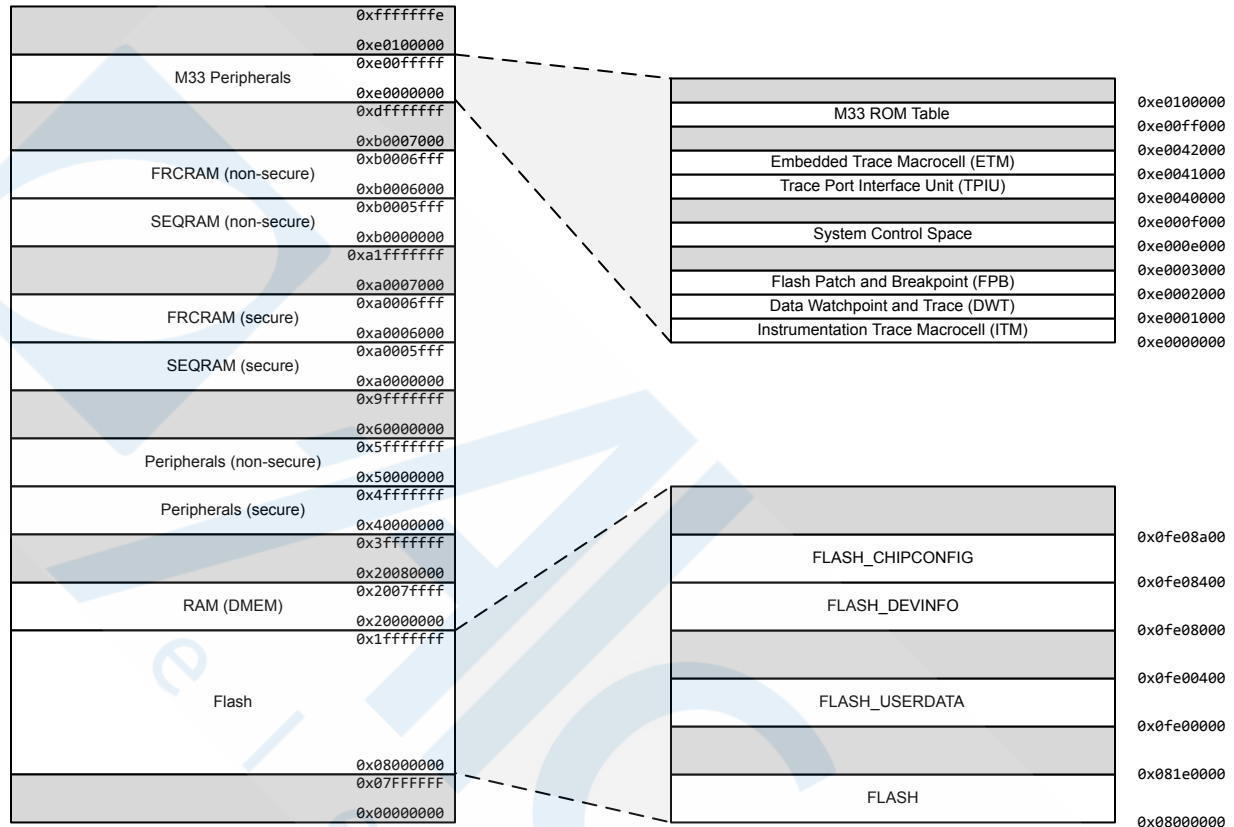

Figure 3.2. EFR32FG25 Memory Map — Core Peripherals and Code Space

### 3.13 Configuration Summary

The features of the EFR32FG25 are a subset of the feature set described in the device reference manual. The table below describes device specific implementation of the features. Remaining modules support full configuration.

**Table 3.3. Configuration Summary**

Module	Lowest Energy Mode	Configuration
I2C0	EM2 <sup>1</sup>	
I2C1	EM1	
IADC0	EM2	
LETIMER0	EM2 <sup>1</sup>	24-bit
TIMER0	EM1	32-bit, 3-channels, +DTI
TIMER1		
TIMER2	EM1	16-bit, 3-channels, +DTI
TIMER3		
TIMER4		
TIMER5		
TIMER6		
EUSART0	EM1 - Full high-speed operation, all modes EM2 <sup>1</sup> - Low-energy UART operation, 9600 Baud EM2 or EM3 <sup>1</sup> - Low-energy SPI secondary receiver	
EUSART1	EM1 - Full high-speed operation	
EUSART2		
EUSART3		
EUSART4		
<b>Note:</b>		
1. EM2 and EM3 operation is only supported for digital peripheral I/O on Port A and Port B. All GPIO ports support digital peripheral operation in EM0 and EM1.		

## 4. Electrical Specifications

### 4.1 Electrical Characteristics

All electrical parameters in all tables are specified under the following conditions, unless stated otherwise:

- Devices with an output power rating of +16 dBm using the matching network corresponding to the Band of operation.
- Typical values are based on  $T_A = 25\text{ }^\circ\text{C}$  and all supplies at 3.6 V, by production test and/or technology characterization.
- Minimum and maximum values represent the worst conditions across supply voltage, process variation, and operating temperature, unless stated otherwise.

RF electrical parameters are specified under the following additional constraints, unless stated otherwise:

- Typical (Typ) values are measured:
  - in conducted mode, based on Silicon Laboratories band-specific external RF impedance-matching networks according to Section [5.2 RF Matching Networks](#), and interfacing through a standard coaxial connector at the antenna port to a  $50\ \Omega$  RF source for receiver tests, and  $50\ \Omega$  RF Load for transmitter tests.
  - with VREGVDD = AVDD = PAVDD = 3.6 V with  $0.20\ \Omega$  source resistance, DVDD = IOVDD0-2 = RFVDD = 1.8 V from DC-DC,
  - with all MCU peripherals disabled,
  - with the reference oscillator using a 39 MHz Crystal adjusted to within  $\pm 1$  ppm,
  - and with operating frequency set to  $F_{\text{RANGE}}$  Typ for the specific operating band.
- Minimum (Min) and Maximum (Max) values are taken:
  - over variations in process,
  - with VREGVDD = AVDD = PAVDD adjusted together between their Min and Max voltage given in [Table 4.2 General Operating Conditions on page 24](#)
  - on operating temperature Min and Max defined in [Table 4.2 General Operating Conditions on page 24](#) under Operating ambient temperature range,
  - and on the minimum and maximum operating channel frequency between  $F_{\text{RANGE}}$  Min and  $F_{\text{RANGE}}$  Max for the specific operating RF Band,
  - while keeping all other conditions at typical unless otherwise noted.

Due to on-chip circuitry (e.g. diodes), some EFR32FG25 power supply pins have a dependent relationship with one or more other power supply pins. These internal relationships between the external voltages applied to the various EFR32FG25 supply pins are defined below. Exceeding the below constraints can result in damage to the device and/or increased current draw.

- VREGVDD  $\geq$  DVDD
  - In systems using the DC-DC converter, DVDD (the buck converter output) should not be driven externally and VREGVDD (the buck converter input) must be greater than DVDD (VREGVDD > DVDD)
  - In systems not using the DC-DC converter, DVDD must be shorted to VREGVDD on the PCB (VREGVDD = DVDD)
- AVDD, IOVDD0, IOVDD1, and IOVDD2: No dependency with each other or any other supply pin. Additional leakage may occur if DVDD remains unpowered with power applied to these supplies. See Section [3.8 Analog](#) for details on how voltage supplied to these pins affects some analog operation.
- DVDD  $\geq$  DECOUPLE
- PAVDD  $\geq$  RFVDD

## 4.2 Absolute Maximum Ratings

Stresses beyond those listed below may cause permanent damage to the device. This is a stress rating only and functional operation of the devices at those or any other conditions beyond those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. For more information on the available quality and reliability data, see the Quality and Reliability Monitor Report at <http://www.silabs.com/support/quality/pages/default.aspx>.

**Table 4.1. Absolute Maximum Ratings**

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Storage temperature range	T <sub>STG</sub>		-50	—	+150	°C
Voltage on any supply pin	V <sub>DDMAX</sub>		-0.3	—	3.8	V
Junction temperature	T <sub>JMAX</sub>	-I grade	—	—	+125	°C
Voltage ramp rate on any supply pin	V <sub>DDRAMP</sub> MAX		—	—	1.0	V / $\mu$ s
Voltage on HFXO pins	V <sub>HFXOPIN</sub>		-0.3	—	1.2	V
DC voltage on any GPIO pin	V <sub>DIGPIN</sub>		-0.3	—	V <sub>IOVDD</sub> + 0.3	V
DC voltage on RESETn pin <sup>1</sup>	V <sub>RESETn</sub>		-0.3	—	3.8	V
Total current into VDD power lines	I <sub>VDDMAX</sub>	Source	—	—	200	mA
Total current into VSS ground lines	I <sub>VSSMAX</sub>	Sink	—	—	200	mA
Current per I/O pin	I <sub>IOMAX</sub>	Sink	—	—	50	mA
		Source	—	—	50	mA
Current for all I/O pins	I <sub>IOALLMAX</sub>	Sink	—	—	200	mA
		Source	—	—	200	mA
<b>Note:</b>						
1. The RESETn pin has a pull-up device to the DVDD supply. For minimum leakage, RESETn should not exceed the voltage at DVDD.						

## 4.3 General Operating Conditions

**Note:**

1. The device may operate continuously at the maximum allowable ambient  $T_A$  rating as long as the absolute maximum  $T_{JMAX}$  is not exceeded. For an application with significant power dissipation, the allowable  $T_A$  may be lower than the maximum  $T_A$  rating.  $T_A = T_{JMAX} - (\Theta_{JA} \times \text{PowerDissipation})$ . Refer to the Absolute Maximum Ratings table and the Thermal Characteristics table for  $T_{JMAX}$  and  $\Theta_{JA}$ .
2. The DVDD supply is monitored by the DVDD BOD in EM0/1 and the LE DVDD BOD in EM2/3/4.
3. The system designer should consult the characteristic specs of the capacitor used on DECOUPLE to ensure its capacitance value stays within the specified bounds across temperature and DC bias.
4. The recommended radio crystal frequency for the sub-GHz radio is 39.0 MHz. The minimum and maximum HCLKRADIO frequency in this table represent the design timing limits, which are much wider than the typical crystal tolerance.

**Note:**

1. During radio transmit operations, the RAIL library will place the DCDC into a mode that increases the maximum load current, to support higher TX output power supplied from the DCDC converter.
2. Pulse-pairing is an optional feature to improve performance at radio frequencies below 550 MHz, but has limited output current. It is enabled by default when using RAIL with an IPKVAL setting of 3 or less. Pulse pairing may be disabled from application code by setting IPKVAL > 3. This must be done before RAIL software is initialized.
3. TDK CGA5L3X8R1C475K160AB used for performance characterization. Actual capacitor values can be significantly de-rated from their specified nominal value by the rated tolerance, as well as the application's AC voltage, DC bias, and temperature. The minimum capacitance counting all error sources should be no less than 3.6  $\mu F$ .

#### 4.6.5 SUN O-QPSK radio current consumption with DC-DC at 3.3 V input

SUN O-QPSK DSSS Modulations are defined by IEEE 802.15.4-2020 section 21, and Table 21-4 using the following abbreviations: f = operating frequency (MHz), Rc = baud or Chip rate (kchip/s), RM = Rate mode (index), Rd = Data bit rate (kbps), and PL = PSDU Length (octets). Unless otherwise indicated, typical conditions are: VREGVDD = AVDD = PAVDD = 3.3 V. DVDD = IOVDD0-2 = RFVDD = 1.8 V from DC-DC. T<sub>A</sub> = 25 °C. Minimum and maximum values in this table represent the worst conditions across process variation at T<sub>A</sub> = 25 °C.

#### 4.6.6 SUN OFDM radio current consumption with DC-DC at 3.6 V input

These radio current consumption measurements for Min and Max use the same transceiver settings as the Typ. Measurements use packet length of 250 octets when data rate is 50 kbps or higher, and 20 octets packet length when lower than 50 kbps. OFDM Modulation is defined in 802.15.4-2020 section 20.3. In this table, f = operating frequency in MHz, and the indication "OptX, MCSy" means X as the Option number 1 through 4, and y is the MCS index 0 through 6, and PL = PSDU Length (octets). Unless otherwise indicated, conditions are: VREGVDD = AVDD = PAVDD = 3.6 V. DVDD = IOVDD0-2 = RFVDD = 1.8 V from DC-DC. T<sub>A</sub> = 25 °C.

**Note:**

1. Supported transmit power levels are determined by the ordering part number (OPN). Transmit power ratings for all devices covered in this datasheet can be found in the Max TX Power column of the Ordering Information Table.
2. The transmit power for the 922.3 to 928.1 Band MHz is normally limited by regulatory agency to +13 dBm (20 mW). The 16 dBm devices are recommended with the matching network as shown in the typical connections section.
3. The matching network shown in the typical connections section is optimized for best efficiency at 16 dBm. The maximum output power can be above the maximum rating in certain conditions. Emissions for this band are tested at  $T_A = 25\text{ }^\circ\text{C}$  with the output power set to 13 dBm (20 mW) and 0 dBm (1mW).
4. Measured per ARIB T108, Part 2 Section 3.2,  $f_c = 924\text{ MHz}$ , 922.3 to 928.1 frequency band, 50 kbps, 2FSK, BT = 2,  $\Delta f = \pm 25\text{ kHz}$ , PN9 sequence, 200 kHz channel spacing,  $n = 1$ .
5. The margin to the regulatory limit (-15 dBm) can be increased by selecting lower BT product values. Example settings and resulting margins can be seen in the following table:

BT product	$P_{CH\_ADJ\_50}$ [dBm]	Margin [dB]
2	-15.7	0.7
1.3	-20	5
1.0	-25	10
0.5	-30	15

6. Measured per ARIB T108, Part 2 Section 3.2,  $f_c = 924\text{ MHz}$ , 922.3 to 928.1 frequency band, 100 kbps, 2FSK, BT = 2,  $\Delta f = \pm 25\text{ kHz}$ , PN9 sequence, 400 kHz channel spacing,  $n = 2$ .
7. The spurious emission is calculated according to TELECOM-T245 5th Ed. Spurious Emissions Measurement Procedure Section 4 (6) to (16)

**Note:**

1. Supported transmit power levels are determined by the ordering part number (OPN). Transmit power ratings for all devices covered in this datasheet can be found in the Max TX Power column of the Ordering Information Table.
2. The transmit power for the 863 to 870 Band MHz is normally limited to +14 dBm (25 mW). The 16 dBm devices are recommended for this band with the matching network as shown in the typical connections section.
3. The maximum output power can be above the maximum rating in certain conditions. Emissions for this band are tested at  $T_A = 25^\circ\text{C}$  with the output power set to 14 dBm (25 mW) and 0 dBm (1mW).

#### 4.9.2 RF SUN OFDM Transmitter Characteristics

OFDM Modulation is defined in IEEE 802.15.4-2020 section 20.3 . In these tables the indication "OptX, MCSy" means X as the Option number 1 through 4, and y is the MCS index 0 through 6, and PL is the Packet PPDU Length in octets. Measurements use packet length of 250 octets when data rate is 50 kbps or higher, and 20 octets packet length when lower than 50 kbps.

#### 4.9.2.1 923 MHz Band RF SUN OFDM Transmitter Characteristics

This table is for devices with an output power rating of +16 dBm using the 920 MHz Band matching network as shown in the typical connections section.  $POUT_{13dBm}^1$  is marking the nominal TX setting which is targeting  $POUT = +13$  dBm at typical conditions.

1. With compliance to ARIB STD-T108 part 2, Wi-SUN Alliance PHY Working Group Technical Specification Revision 1VA9, and IEEE 802.15.4-2020 Section 20 except for max power limit
2. Typical frequency is defined in the Test Condition column, and varies on selected Option.
3. Min/Max numbers are measured at typical voltage, at typical  $F_{RANGE}$  frequency, and at  $T_A = 25\text{ }^\circ\text{C}$ .
4. Frequency value used for typical measurements
5. Other operating conditions are kept at Typical values.
6. Per ARIB STD-T108 part 2, section 3.2.8
7. Emissions are measured at  $T_A = 25\text{ }^\circ\text{C}$
8. The spurious emission is calculated according to TELEC-T245 5th Ed. Spurious Emissions Measurement Procedure Section 4 (1) to (4).
9. The spurious emission is calculated according to TELEC-T245 5th Ed. Spurious Emissions Measurement Procedure Section 4 (6) to (16).
10. All Operating Conditions are Typical / Nominal only in accordance to Wi-SUN Alliance PHY Working Group Technical Specification Revision 1VA9 section 8.2.7.

#### 4.9.2.2 914 MHz Band RF SUN OFDM Transmitter Characteristics

This table is for devices with an output power rating of +16 dBm using the 915 MHz Band matching network as shown in the typical connections section. POUT<sub>16dBm</sub><sup>1</sup> is marking the nominal TX setting which is targeting +16 dBm output power at typical conditions. POUT<sub>12dBm</sub><sup>1</sup> is marking the nominal TX setting which is targeting +12 dBm output power at typical conditions.

#### 4.9.4 RF SUN O-QPSK Receiver Characteristics

SUN O-QPSK DSSS Modulations are defined by IEEE 802.15.4-2020 section 21, and Table 21-4 using the following abbreviations: Rc = baud or Chip rate (kchip/s), RM = Rate mode (index), Rd = bit data rate (kbps), and PL = PSDU Length (octets). Measurements use packet length of 250 octets when data rate is 50 kbps or higher, and 20 octets packet length when lower than 50 kbps.

**Note:**

1. The undesired signal shall be a compliant SUN O-QPSK PHY PSDU according to IEEE 802.15.4-2020 section 21.5.4 containing a pseudo random bit sequence which is different from the desired signal. The undesired signal omits the SHR and PHR, uses chip-whitening, and the chip rate and spreading mode are the same as the desired signal.
2. The specification is less than ± 6 dB error at all power levels between 10 dB above required sensitivity to 50 dB above required sensitivity.

#### 4.9.5 RF Wi-SUN FSK Receiver Characteristics

Wi-SUN FSK Modulations are defined in Wi-SUN Alliance PHY Working Group (PHYWG TPS) Wi-SUN PHY Technical Specification - Amendment 1VA9 November 2022. The PHY modulations in this table use BT = 2 and are indicated by (T, M, C) where T is the Phy Mode ID Type, and M is the Mode from PHY WG TPS Tables 2, 3, and 4. Also, C is the Channel Plan ID from PHY WG TPS Tables 6 and 7. The PHYWG TPS also references IEEE 802.15.4-2020 section 19 especially. Measurements use packet length of 250 octets when data rate is 50 kbps or higher, and 20 octets packet length when lower than 50 kbps.

The following table gives information about the different Wi-SUN FSK configurations that are supported by this device family. This section is meant to be informative, in case of any contradiction the Wi-SUN PHY TPS takes precedence.

4. Wi-SUN FSK Operating Frequency channel plan follows PHYWG TPS 1VA9, Tables 6 and 7.
5. Wi-SUN FSK Phy Mode ID is from Wi-SUN Standard PHYWG TPS 1VA9, Tables 2, 3, and 4. See also Table 16 first and second column.
6. Viterbi DeMod is enabled when modulation index (mi) is less than 1.0, and disabled when mi is 1.0 or higher.
7. Approximation of the modulation signal occupied channel bandwidth for information purpose.
8. Europe Region uses smaller channel spacing
9. Modulations use interleaving only with FEC. Also, when FEC is used it must be NRNSC.

#### 4.9.5.1 923 MHz Band RF Wi-SUN FSK Receiver Characteristics

Unless otherwise indicated, typical conditions are:  $T_A = 25^\circ\text{C}$ ,  $V_{\text{REGVDD}} = \text{PAVDD} = \text{AVDD} = 3.3\text{ V}$ ,  $\text{DVDD} = \text{IOVDD0-2} = \text{RFVDD} = 1.8\text{ V}$  from DC-DC regulator output, external PA Supply, supply filtering as shown in the typical connections section, crystal frequency =  $39.0\text{ MHz} \pm 1\text{ ppm}$ .

7. Using Preamble Field signal (section 19.2.3.1 of IEEE 802.15.4-2020), sweep Antenna input level in 2 dB steps starting from 10 dB above required sensitivity to 50 dB above required sensitivity of 802.15.4-2020 section 19.6.7 . At each 2 dB step, record the input signal level at the 50 Ω Antenna port along with the signal level measured by the receiver averaged over 8 Preamble Fields. The Magnitude Error is the absolute value of the difference between these two at the 2 dB step with the worst Error. AGC\_PreamME = Max( |Avg(Rx\_meas) - Rx\_applied| ).

**4.9.6 RF SUN OFDM Receiver Characteristics**

OFDM Modulation is defined in Wi-SUN Alliance PHY Working Group (PHYWG TPS) Wi-SUN PHY Technical Specification - Amendment 1VA9 November 2022 which refers to IEEE 802.15.4-2020 especially section 20.3 . In this table the indication "OptX, MCSy" means X as the Option number 1 through 4, and y is the MCS index 0 through 6, and PL is the Packet PPDU Length in octets. Unless otherwise specified, for OFDM Options 1 and 2 header is normally MCS0, for Option 3 header is normally MCS1, and for Option 4 header is normally MCS2. Measurements use packet length of 250 octets when data rate is 50 kbps or higher, and 20 octets packet length when lower than 50 kbps.

**Note:**

1. Typical frequency is defined in the Test Condition column, and varies on selected Option.
2. Min/Max numbers are measured at typical voltage, at typical  $F_{\text{RANGE}}$  frequency, and at  $T_A = 25\text{ }^\circ\text{C}$ .
3. The undesired signal shall use the same modulation type and settings as the desired signal being tested, but containing different pseudo random data in its PSDU. STF and LTF are excluded from the frame of the undesired signal.
4. Using a Short Training Field signal (section 20.2.2 of IEEE 802.15.4-2020), sweep Antenna input level in 2 dB steps starting from 10 dB above required sensitivity to 50 dB above required sensitivity of the Option in test with MCS0 in 802.15.4-2020 Table 20-21. At each 2 dB step, record the input signal level at the 50  $\Omega$  Antenna port along with the signal level measured by the receiver averaged over 8 STF symbols. The Magnitude Error is the absolute value of the difference between these two at the 2 dB step with the worst Error.  $AGC\_STFME = \text{Max}( |\text{Avg}(\text{Rx\_meas}) - \text{Rx\_applied}| )$ .

**Note:**

1. Min/Max numbers are measured at typical voltage, at typical  $F_{\text{RANGE}}$  frequency, and at  $T_A = 25\text{ }^\circ\text{C}$ .
2. The undesired signal shall use the same modulation type and settings as the desired signal being tested, but containing different pseudo random data in its PSDU. STF and LTF are excluded from the frame of the undesired signal.
3. Using a Short Training Field signal (section 20.2.2 of IEEE 802.15.4-2020), sweep Antenna input level in 2 dB steps starting from 10 dB above required sensitivity to 50 dB above required sensitivity of the Option in test with MCS0 in 802.15.4-2020 Table 20-21. At each 2 dB step, record the input signal level at the 50  $\Omega$  Antenna port along with the signal level measured by the receiver averaged over 8 STF symbols. The Magnitude Error is the absolute value of the difference between these two at the 2 dB step with the worst Error.  $AGC\_STFME = \text{Max}(|\text{Avg}(\text{Rx\_meas}) - \text{Rx\_applied}|)$ .

## 4.10 Oscillators

### 4.10.1 High Frequency Crystal Oscillator

Unless otherwise indicated, typical conditions are: AVDD = DVDD = RFVDD = PAVDD = VREGVDD = IOVDD0-2 = 3.6 V. DC-DC not used. T<sub>A</sub> = 25 °C. Minimum and maximum values in this table represent the worst conditions across process variation, operating supply voltage range, and operating temperature range.

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
<b>Note:</b>						
1. All sub-GHz RF measurements made using a 39 MHz crystal. Other crystal frequencies supported, but RF performance may vary.						
2. The crystal should have a maximum ESR less than or equal to this maximum rating.						
3. Total load capacitance as seen by the crystal.						
4. It is recommended to use a crystal with a 10 pF load capacitance rating. Only crystals with a 10 pF load cap rating have been characterized for RF use.						
5. Startup time does not include time implemented by programmable TIMEOUTSTEADY delay.						
6. The tuning step size is the effective step size when incrementing both of the tuning capacitors by one count. The step size for the each of the individual tuning capacitors is twice this value.

On-chip tuning capacitor value at maximum setting <sup>5</sup>	$C_{LFXO\_MAX}$	CAPTUNE = 0x4F	—	27.7	—	pF

**Note:**

1. Total load capacitance seen by the crystal
2. Crystals with a load capacitance of greater than 12 pF require external load capacitors.
3. In LFXO\_CAL Register
4. In LFXO\_CFG Register
5. The effective load capacitance seen by the crystal will be  $C_{LFXO}/2$ . This is because each XTAL pin has a tuning cap and the two caps will be seen in series by the crystal

### 4.10.3 High Frequency RC Oscillator (HFRCO)

Unless otherwise indicated, typical conditions are: AVDD = DVDD = RFVDD = PAVDD = VREGVDD = IOVDD0-2 = 3.6 V. DC-DC not used. T<sub>A</sub> = 25 °C. 		FREQRANGE = 14	48.8	—	74.8	MHz
FREQRANGE = 15	57.6	—	87.4	MHz		

**Note:**

1. Does not include additional clock tree current. See specifications for additional current when selected as a clock source for a particular clock multiplexer.
2. When HFRCO is activated the FSRCO is also activated. This prevents direct measurement of only the HFRCO current. The specified current for HFRCO does not include the FSRCO current which is typically 41 µA.
3. This frequency is calibrated for the HFRCOEM23 only.
4. This frequency is calibrated for the HFRCODPLL (HFRCO0) only.
5. When the HFRCO is enabled for characterization using the FORCEEN bit, the total current will be the HFRCO core current plus the specified CLKOUT current. When the HFRCO is enabled on demand, the clock current may be different.
6. Hardware delay ensures settling to within ± 0.5%. Hardware also enforces this delay on a band change.
7. The frequency band limits represent the lowest and highest frequency which each band can achieve over the operating range.

**Note:**

1. When inputs are routed to external GPIO pins, the maximum pin voltage is limited to the lower of the IOVDD and AVDD supplies.
2. ADC output resolution depends on the OSR and digital averaging settings. With no digital averaging, ADC output resolution is 12 bits at OSR = 2, 13 bits at OSR = 4, 14 bits at OSR = 8, 15 bits at OSR = 16, 16 bits at OSR = 32 and 17 bits at OSR = 64. Digital averaging has a similar impact on ADC output resolution. See the product reference manual for additional details.
3. The relationship between ENOB and SNDR is specified according to the equation:  $ENOB = (SNDR - 1.76) / 6.02$ .
4. Includes error from internal VREF drift.

External Reference Voltage <sup>7</sup>	V <sub>EXTREF</sub>		1.1	—	V_AVDD	V

**Note:**

1. Main outputs only.
2. Dynamic current specifications are for VDAC circuitry operating at max clock frequency with the output updated at the specified sampling rate using DMA transfers. Output is a 1 kHz sine wave from 10% to 90% full scale. Specified current does not include current required to drive the external load. Measurement includes all current from AVDD and DVDD supplies.
3. Static current specifications are for VDAC circuitry operating after a one-time update to a static output at 50% full scale, with the VDAC APB clock disabled. Specified current does not include current required to drive the external load. Measurement includes all current from AVDD and DVDD supplies.
4. PSRR calculated as  $20 * \log_{10}(\Delta V_{DD} / \Delta V_{OUT})$ .
5. Entire range is monotonic and has no missing codes.
6. Gain is calculated by measuring the slope from 10% to 90% of full scale. Offset is calculated by comparing actual VDAC output at 10% of full scale to ideal VDAC output at 10% of full scale with the measured gain.
7. External reference voltage on PA00 when used for VREFP

Temperature sensor accuracy <sup>2 3</sup>	T <sub>ACC</sub>	Direct output accuracy after mean error (T <sub>OFF</sub> ) removed	—	+/-3	—	°C
		After linearization in software, no calibration	—	+/-2	—	°C
		After linearization in software, with single-temperature calibration at 25 °C <sup>4</sup>	—	+/-1.5	—	°C
Measurement interval	t <sub>MEAS</sub>		—	250	—	ms

**Note:**

1. The sensor reports absolute die temperature in Kelvin (K). All specifications are in °C to match the units of the specified product temperature range.
2. Error is measured as the deviation of the mean temperature reading from the expected die temperature. Accuracy numbers represent statistical minimum and maximum using ± 4 standard deviations of measured error.
3. The raw output of the temperature sensor is a predictable curve. It can be linearized with a polynomial function for additional accuracy.
4. Assuming calibration accuracy of ± 0.25 °C.

## 4.16 Brown Out Detectors

### 4.16.1 DVDD BOD

BOD thresholds on DVDD in EM0 and EM1 only, unless otherwise noted. Typical conditions are at  $T_A = 25\text{ }^\circ\text{C}$ . Minimum and maximum values in this table represent the worst conditions across process variation, operating supply voltage range, and operating temperature range.

**Table 4.46. DVDD BOD**

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
BOD threshold	$V_{DVDD\_BOD}$	Supply Rising	—	1.68	1.71	V
		Supply Falling	1.62	1.65	—	V
BOD response time	$t_{DVDD\_BOD\_DELAY}$	Supply dropping at 100 mV/ $\mu$ s slew rate <sup>1</sup>	—	0.95	—	$\mu$ s
BOD hysteresis	$V_{DVDD\_BOD\_HYS\_T}$		—	22	—	mV

**Note:**

1. If the supply slew rate exceeds the specified slew rate, the BOD may trip later than expected (at a threshold below the minimum specified threshold), or the BOD may not trip at all (e.g., if the supply ramps down and then back up at a very fast rate)

### 4.16.2 LE DVDD BOD

BOD thresholds on DVDD pin for low energy modes EM2 to EM4, unless otherwise noted.

**Table 4.47. LE DVDD BOD**

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
BOD threshold	$V_{DVDD\_LE\_BOD}$	Supply Falling	1.5	—	1.71	V

Repeated START condition set-up time	t <sub>SU_STA</sub>		0.26	—	—	μs
Repeated START condition hold time	t <sub>HD_STA</sub>		0.26	—	—	μs
STOP condition set-up time	t <sub>SU_STO</sub>		0.26	—	—	μs
Bus free time between a STOP and START condition	t <sub>BUF</sub>		0.5	—	—	μs

**Note:**

1. The maximum SCL clock frequency listed is assuming that an arbitrary clock frequency is available. The maximum attainable SCL clock frequency may be slightly less using the HF XO or HFRCO due to the limited frequencies available. The CLKDIV should be set to a value that keeps the SCL clock frequency below the max value listed.

### 4.21 Boot Timing

Secure boot impacts the recovery time from all sources of device reset. In addition to the root code authentication process, which cannot be disabled or bypassed, the root code can authenticate a bootloader, and the bootloader can authenticate the application. In projects that include only an application and no bootloader, the root code can authenticate the application directly. The duration of each authentication operation depends on two factors: the computation of the associated image hash, which is proportional to the size of the image, and the verification of the image signature, which is independent of image size.

The duration for the root code to authenticate the bootloader will depend on the SE firmware version as well as on the size of the bootloader.

The duration for the bootloader to authenticate the application can depend on the size of the application.

The configurations below assume that the associated bootloader and application code images do not contain a bootloader certificate or an application certificate. Authenticating a bootloader certificate or an application certificate will extend the boot time by an additional 6 to 7 ms.

The table below provides the durations from the termination of reset until the completion of the secure boot process (start of main() function in the application image) under various conditions.

Conditions:

- SE firmware version: 2.1.7
- Gecko Bootloader size: 24 kB

Timing is expected to be similar for subsequent SE firmware versions. Refer to SE firmware release notes for any significant changes.

**Table 4.56. Boot Timing**

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Boot time	$t_{BOOT}$	Secure boot application check disabled, no bootloader	—	31.6	—	ms
		Secure boot application check disabled, second stage bootloader check enabled, 50 kB application size	—	37.6	—	ms
		Secure boot application check enabled, second stage bootloader check enabled, 50 kB application size	—	47.9	—	ms
		Secure boot application check enabled, second stage bootloader check enabled, 150 kB application size	—	49.8	—	ms
		Secure boot application check enabled, second stage bootloader check enabled, 350 kB application size	—	53.9	—	ms

#### 4.22 Crypto Operation Timing for SE Manager API

Values in this table represent timing from SE Manager API call to return. The Cortex-M33 HCLK frequency is 39.0 MHz. The timing specifications below are measured at the SE Manager function call API. Each duration in the table contains some portion that is influenced by SE Manager build compilation and Cortex-M33 operating frequency and some portion that is influenced by the Hardware Secure Engine's firmware version and its operating speed (typically 80 MHz). The contributions of the Cortex-M33 properties to the overall specification timing are most pronounced for the shorter operations such as AES and hash when operating on small payloads. The overhead of command processing at the mailbox interface can also dominate the timing for shorter operations.

Conditions:

- SE firmware version: 2.1.7
- GSDK version: 4.0.0

Timing is expected to be similar for subsequent SE firmware versions. Refer to SE firmware release notes for any significant changes.

#### 4.23 Crypto Operation Average Current for SE Manager API

Values in this table represent current consumed by security core during the operation, and represent additions to the current consumed by the Cortex-M33 application CPU due to the Hardware Secure Engine CPU and its associated crypto accelerators. The current measurements below represent the average value of the current for the duration of the crypto operation. Instantaneous peak currents may be higher.

Conditions:

- SE firmware version: 2.1.7
- GSDK version: 4.0.0

Current consumption is expected to be similar for subsequent SE firmware versions. Refer to SE firmware release notes for any significant changes.

#### 6.4 Analog Peripheral Connectivity

Many analog resources are routable and can be connected to numerous GPIO's. The table below indicates which peripherals are available on each GPIO port. When a differential connection is being used Positive inputs are restricted to the EVEN pins and Negative inputs are restricted to the ODD pins. When a single ended connection is being used positive input is available on all pins. See the device Reference Manual for more details on the ABUS and analog peripherals. Note that some functions may not be available on all device variants.

aaa	0.10		
bbb	0.07		
ccc	0.10		
ddd	0.05		
eee	0.08		
fff	0.10		

**Note:**

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing per ANSI Y14.5M-1994.
3. This drawing conforms to the JEDEC Solid State Outline MO-247.
4. Recommended card reflow profile is per the JEDEC J-STD-020C specification for small body, lead-free components.

7.2 QFN56 PCB Land Pattern

Dimension	Typ
C1	6.87
C2	6.87
W1	4.80
L1	4.80
e	0.40
L	0.86
W	0.22
R	0.11

Dimension	Typ
<b>Note:</b>	
1. All dimensions shown are in millimeters (mm) unless otherwise noted.	
2. Dimensioning and Tolerancing is per the ANSI Y14.5M-1994 specification.	
3. This Land Pattern Design is based on the IPC-SM-782 guidelines.	
4. All dimensions shown are at Maximum Material Condition (MMC). Least Material Condition (LMC) is calculated based on a Fabrication Allowance of 0.05 mm.	
5. All pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 µm minimum, all the way around the pad.	
6. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.	
7. The stencil thickness should be 0.100 mm (4 mils).	
8. The ratio of stencil aperture to land pad size should be 1:1 for the perimeter pads.	
9. A No-Clean, Type-3 solder paste is recommended.	
10. The recommended card reflow profile is per the JEDEC/IPC J-STD-020C specification for Small Body Components.	
11. <b>Above notes and stencil design are shared as recommendations only. A customer or user may find it necessary to use different parameters and fine tune their SMT process as required for their application and tooling.</b>	

### 7.3 QFN56 Package Marking

Figure 7.3. QFN56 Package Marking

The package marking consists of:

- FFFF – The product family codes.
  1. Family Code (F)
  2. G (Gecko)
  3. Series (2)
  4. Device Configuration (5)
- PPPPPP – The product option codes.
  - 1. Security ( A = Secure Vault Mid | B = Secure Vault High )
  - 2-4. Product Feature Codes
  - 5. Flash ( U = 1920k | T = 1152k )
  - 6. Temperature grade ( I = -40 to 125 °C )
- TTTTTT – A trace or manufacturing code. The first letter is the device revision.
- YY – The last 2 digits of the assembly year.
- WW – The 2-digit workweek when the device was assembled.

## 8. Revision History

### Revision 1.0

January, 2023

- Entered min/max specs values for TBDs
- Added new specs for different testing conditions

### Revision 0.5

December, 2022

- Entered typical spec values for TBDs

### Revision 0.43

October, 2022

- Changed tests in 490 MHz Band RF SUN OFDM Transmitter Characteristics table
- Updated the detailed block diagram
- Updated Package Marking
- Changed test conditions
- Entered typical spec values for TBDs
- Removed Thermistor Driver Spec Table
- Added typical performance curves

### Revision 0.42

October, 2022

- Entered typical spec values for TBDs

### Revision 0.41

September, 2022

- Entered typical spec values for TBDs
- Removed some tests
- Removed O-QPSK tables

### Revision 0.4

September, 2022

- Added OPN Decoder
- Changed test conditions
- Entered typical spec values for TBDs
- Renamed test symbol
- Added matching network for 470 MHz

### Revision 0.3

June, 2022

- Clarify test conditions
- Update tested parameters
- Include Crypto Operation Characterization

**Revision 0.2**

January, 2022

- Changed Test Conditions and footnotes for several specifications to correct errors and clarify
- Changed Operating Conditions to be more clear
- Updated some security system details
- Changed Typical Connection Diagrams and matching network
- Corrected errors

**Revision 0.1**

July, 2021

Initial release.
